

AMENDMENTS TO THE CLAIMS:

Claims 1-17 (cancelled).

18. (Currently Amended) The plasma radiation source comprising:

a source region in a vacuum chamber for emitting radiation at a defined solid angle ~~through a gas curtain that is provided for debris suppression~~ along an axis of the mean direction of propagation of the radiation through a gas curtain that is provided for debris suppression;

said gas curtain being a radially directed supersonic gas jet, proceeds from a propulsion nozzle of a gas jet vacuum pump;

said propulsion nozzle being arranged on an axis of the mean propagation direction of the radiation; and

said gas curtain being directed to an annular mixing nozzle of the gas jet vacuum pump arranged coaxial to the axis and being guided out of the vacuum chamber by a diffuser.

19. (Previously Presented) The plasma radiation source according to claim 18, wherein a discharge is used for plasma excitation and an electrode arrangement with anodes and cathodes arranged next to one another along the axis of the mean propagation direction of the radiation is provided for the discharge.

20. (Previously Presented) The plasma radiation source according to claim 19, wherein liquid metal electrodes are used as electrodes.

21. (Previously Presented) The plasma radiation source according to claim 20, wherein the liquid metal electrode has a carrier which is penetrated by a supply channel for a liquid emitter and which is coated at its end facing the plasma with a high-melting porous material into which the supply channel opens.

22. (Previously Presented) The plasma radiation source according to claim 20, wherein the liquid metal electrode is outfitted with a heating device.

23. (Previously Presented) The plasma radiation source according to claim 21, wherein the

carrier and the porous material are electrically conductive.

24. (Previously Presented) The plasma radiation source according to claim 21, wherein the carrier and the porous material are not electrically conductive.

25. (Previously Presented) The plasma radiation source according to claim 23, wherein the carrier and the porous material are chemically identical.

26. (Currently Amended) The plasma radiation source according to claim 19, wherein a pinch effect generated by the a current flow along the axis is additionally supported by an external magnetic field around the plasma.

27. (Previously Presented) The plasma radiation source according to claim 26, wherein the external magnetic field is formed as a static magnetic field.

28. (Previously Presented) The plasma radiation source according to claim 26, wherein the external magnetic field is adapted to the current flow through the plasma.

29. (Previously Presented) The plasma radiation source according to claim 18, wherein laser radiation is used to excite plasma.

30. (Previously Presented) The plasma radiation source according to claim 18, wherein a reflector is provided adjacent to a source region for the plasma along the axis of the mean propagation direction of the radiation, which reflector refocuses the radiation through the plasma.

31. (Previously Presented) The plasma radiation source according to claim 18, wherein the gas curtain is adjacent to the source region along the axis of the mean propagation direction of the radiation exclusively on the side of an application region.

32. (Previously Presented) The plasma radiation source according to claim 30, wherein the

gas curtain is adjacent to the source region along the axis of the mean propagation direction of the radiation on both sides.

33. (Previously Presented) An arrangement for generating a gas curtain as a filter for particles in radiation whose mean propagation direction extends in a vacuum chamber along an axis directed through the gas curtain, comprising:

a gas jet vacuum pump with a propulsion nozzle being arranged on an axis for generating a supersonic gas jet for the gas curtain and directing the supersonic gas jet radially to an annular mixing nozzle of the gas jet vacuum pump;

said mixing nozzle being arranged coaxial to the axis; and

a diffuser being provided for guiding the supersonic gas jet out of the vacuum chamber.

34. (Currently Amended) A gas jet vacuum pump comprising:

an annular mixing nozzle having a gas inlet opening which faces the annular center;

a propulsion nozzle being arranged in the annular center for generating a supersonic gas jet that proceeds radially from the propulsion nozzle and is directed to the gas inlet opening; and

an annular diffuser which works so as to ~~be directed~~ direct the gas away from the annular center.
